

Installing the MiGS Cert in Apache/PHP

This is to show how to get the new MiGS DR SSL certificate into a UNIX Apache/PHP/cURL

1. Download the MiGS cert to your local server.

2. Using the keytool utility, enter the following:

```
keytool -import -alias <alias> -keystore <your_keystore_filename> -  
trustcacerts -file <filename_of_the_chain>
```

For example (if the key store is in c:\mykeystore):

```
C:\>keytool -import -alias MiGSDR2012 -keystore c:\mykeystore -  
trustcacerts -file c:\KSC10-migs.mastercard.com.au.crt
```

```
Enter keystore password: (default is 'changeit')
```

```
Certificate was added to keystore.
```

3. Restart your Apache server.

4. Do a test transaction.

* Above instruction is an example only and maybe varied depends on the web server environment.
